

NORMALIZATION:

It is a relationship database concept and is done in the process of building ER. If the correct entity model is being built will conform to the rules of normalization. Each rule has corresponding data model interpretation, which can be used to validate placement of attributes in ER Model.

Normalization of car vehicle insurance company:

OUTPUT

The screenshot shows the MySQL Workbench interface. The main editor displays a SQL query with line numbers 11 to 20. The query is a complex SELECT statement involving multiple tables and subqueries. The output pane at the bottom shows the execution results of the query, including a table of results and a log of actions.

SQL Query:

```

11
12 • select *
13   from T10_INSURANCE_COMPANY
14  where T10_10_Company_Name in
15        (select T10_INSURANCE_COMPANY.T10_10_Company_Name
16         from T10_INSURANCE_COMPANY
17         group by T10_10_Company_Name
18         having count(distinct (T10_10_Company_Address))>1 and T10_10_Company_Name in
19                (select T10_DEPARTMENT.T10_10_Company_Name
20                 from T10_PRODUCT inner join T10_DEPARTMENT

```

Output Table:

T10_10_Company_Name	T10_10_Company_Address	T10_10_Company_Contact_Number	T10_10_Company_Fax	T10_10_Company_Email	T10_10_Company_...
...

Action Output Log:

#	Time	Action	Message	Duration / Fetch

QUERY 5

SELECT T10_VEHI...*,T10_5_Premium_Payment_Amount FROM
T10_VEHI...T10_PREMIUM_PAYMENT

WHERE (T10_5_Premium_Payment_Amount > T10_6_Vehicle_Number AND
T10_PREMIUM_PAYMENT.T10_1_Cust_Id = T10_VEHI...T10_6_Cust_Id
);

OUTPUT

The screenshot shows the MySQL Workbench interface. The 'Schemas' pane on the left shows a database named 'insurance_policy' with tables 't10_application', 't10_claim_settlement', 't10_claim', and 't10_coverage'. The main editor shows a SQL query (Query 4) that selects data from 'T10_CUSTOMER' based on a complex join condition involving 'T10_INCIDENT_REPORT', 'T10_VEHICLE', and 'T10_PREMIUM_PAYMENT'. The 'Result Grid' displays the following data:

T10_6_Vehicle_Id	T10_6_Policy_Id	T10_6_Dependent_NOK_Id	T10_6_Vehicle_Registration_Number	T10_6_Vehicle_Value	T10_6_Vehicle_Type	T10_6_Veh...
1000	10611	10000034	KA-25 HA 1985	1074773	Sports Car	10002
1001	106341	10000234	TA-44 AR 9871	127489	COUPE	10004
10010	103531	10623492	MA-78 MU 1633	1032242122	CONVERTIBLE	10362
10011	105435	10364373	P3-20 LU 1414	1073412305	PICKUP	10834
10014	1095075	10236443	MA-19 TH 2712	103330323	HATCHBACK	10630
1004	107291	10003562	MA-17 NA 7118	1073733	SEDAN	10671
1005	102863	10273892	TN-19 CH 2810	1027189	COUPE	10267
1008	103981	10329847	KA-27 HA 5643	10239873	PICKUP	10372

The 'Output' pane at the bottom shows the execution of three queries. Query 4 (16:41:21) returned 0 rows. Query 5 (16:42:36) returned 2 rows. Query 6 (16:43:13) returned 8 rows.

QUERY 6

select *

from T10_CUSTOMER where T10_1_Cust_Id

in (select distinct (T10_CLAIM.T10_1_Cust_Id)

from T10_CLAIM , T10_CLAIM_SETTLEMENT , T10_COVERAGE

where T10_CLAIM.T10_7_Claim_Amount >

T10_CLAIM_SETTLEMENT.T10_8_Claim_Settlement_Id +

T10_CLAIM_SETTLEMENT.T10_6_Vehicle_Id +

T10_CLAIM.T10_7_Claim_Id + T10_CLAIM.T10_1_Cust_Id and

T10_16_Coverage_Amount > T10_CLAIM.T10_7_Claim_Amount);

OUTPUT

The screenshot displays the MySQL Workbench interface. The left sidebar shows the 'SCHEMAS' panel with a tree view containing 'cascade' and 'Tables' (t10_application, t10_claim_settlement, t10_claim, t10_coverage). The main editor shows a SQL query (QUERY 5) with a WHERE clause filtering by premium payment amount and customer ID. Below the query, the 'Result Grid' shows a table with columns: T10_1_Cust_Id, T10_1_Cust_FName, T10_1_Cust_LName, T10_1_Cust_DOB, T10_1_Cust_Gender, T10_1_Cust_Address, T10_1_Cust_MOB_Number, and T10_1_Cust_Email. The data rows show two records: one for Sharath Kumar (DOB: 1985-07-20, Gender: Male, Address: 2-2-7654/33/J/1, MOB: 9124356780, Email: LPMD@...) and one for Henry David (DOB: 1962-11-23, Gender: Male, Address: 2-2-5881/89/N/5, MOB: 9848032198, Email: RAM@...). The bottom panel shows the 'Output' tab with a table of action results, including the execution time and the number of rows returned for each query.

T10_1_Cust_Id	T10_1_Cust_FName	T10_1_Cust_LName	T10_1_Cust_DOB	T10_1_Cust_Gender	T10_1_Cust_Address	T10_1_Cust_MOB_Number	T10_1_Cust_Email
109	Sharath	Kumar	1985-07-20	Male	2-2-7654/33/J/1	9124356780	LPMD@...
1044	Henry	David	1962-11-23	Male	2-2-5881/89/N/5	9848032198	RAM@...

Conclusion

We have as class project created database (DB) with all documentations and reports included. Our goal was to create DB for Online car vehicle insurance company with code generated for MySQL. There were some big and small challenges but we succeeded in making a functional DB. We started to build conceptual data model (CDM) we continued with logical data model (LDM) and then we made physical data model (PDM) all in MySQL

Workbench. From physical data model we created a code to be run in MySQL data base management system (DBMS). For better understanding for a reader and for our learning we included some theory in each phase we done and documented in project initial document (PID) with reports of progress and work being done.

DELETE CASCADE PROBLEM

ON DELETE RESTRICT means you **can't** delete a given **parent row** if a **child row exists** that references the value for that parent row. If the parent row has no referencing child rows, then you can delete that parent row.
